

Gist of medical report provided by Professor Fox dated 7<sup>th</sup> February 2017.

The report diagnosed HN40 as suffering from PTSD and a linked disorder. If real name is revealed, it would worsen severity of PTSD such that there would be a risk of self harm or harm to others. HN40 would also become unfit for work. The same consequences would follow from disclosing the cover name. If a restriction order is granted over both then there is a good chance of symptom recovery.
