

Proposed gist of HN86 medical report: Dr Singh dated 8 May 2018

Dr Singh met with HN86 in March 2018. He also had access to various medical records of HN86. Those records confirm that the HN86 is receiving medication.

Dr Singh diagnoses HN86 as having both a generalised anxiety disorder and a panic disorder with longstanding symptoms. His mental state has worsened since the onset of the Inquiry. Dr Singh concludes that it is highly likely that HN86's mental state will destabilise and his illness will become worse, including the likely onset of additional symptoms, if his real or undercover identities are released. Dr Singh's opinion is that HN86 will find any direct engagement with Public Inquiry extremely stressful.
